

# AI Dev-AIOps Project

# Example Scenarios

- Example 1:
  - Building a basic three tier LAMP web site architecture into a single virtual machine. Your AI coding agent suggests separating them into independent instances for better design practice.
  - During operation, your database becomes the performance bottleneck. Anomaly events triggers AIOps agent to investigate and suggest replacing existing DB instance using RDS with read replica.
- Example 2:
  - Building a basic three tier LAMP web site architecture. Your AI coding agent suggests adding load balancing and auto scaling for better reliability and availability.
  - During operation, your web site is too busy to handle the incoming traffic due to auto scaling reaches its maximum and the instance size is not powerful enough. Anomaly events triggers AIOps agent to investigate and suggest solutions.

# Deliverables

- A proposal outlines
  - the plan of your system
  - the story you would like to demo.
- On St. Thomas Canvas site, please submit a report by demo day
  - contains a link to a GitHub repo of your implementation. Your implementation is expected to deploy a working AIDev-AIOps system.
  - how you configured and implemented this assignment. Please include the prompts used and environment settings, such as versions and names of your agents, models, skills, MCP servers, knowledge bases, etc.
  - describes the scenario you will present. AWS well architected framework provides many good examples of patterns and anti-patterns.
    - AI coding agent handles issues known at implementation.
    - AIOps agent handles issues detected during operation.
  - Optionally, you may test and report your system's performance (accuracy, efficiency, etc.) under different settings, such as, models, prompts, and knowledge bases.
  - please list/cite all literatures, web pages, books, and any resources that you referenced when working on your report.
- You are expected to do a live demo in class on AIOps Project Demo day.

# Evaluation Criteria

- Completeness:
  - A report well describes your implementation and demo scenario.
  - A working implementation.
  - A clear live demo in class.
- Originality:
  - Your own works with AI assistance. No plagiarism.
- Reasonable:
  - The demo scenario makes sense clearly describes anti-patterns and patterns.
- Clarity:
  - Your report and presentation are well-organized, easy to follow, and effectively communicated.
- References:
  - Proper and valid citation of any resources used in the project.
