

Overview

Create an automated software delivery pipeline using GitHub, CodeBuild, and CodePipeline.

Tasks

Add a manual review stage to the pipeline created in the class. Specifically, after checking in the code, the pipeline paused in this stage and maintainer will be notified to review the changes. The pipeline resumes after the changes are approved.

Submit your work

Create a new GitHub repository. Please push your template files to this repository and submit this GitHub repository's URL on Canvas. Please also submit a report which states how you verified your implementation using CLI or browser. The report should also include the outputs from your verification process.

Terminate AWS resources

Remember to terminate all the resources created in this project.
